WHAT IS 100% DECENTRALIZED PLATFORM

A 100% Decentralized Platform refers to a system or network where control and decision making are distributed among all participants, with no single entity or authority having full control. Key characteristics include:

- 1. No Central Authority:** No single entity controls the platform or its data.
- 2. Distributed Ledger:** Often uses block chain technology to record transactions and data.
- 3. Peer-to-Peer (P2P):** Participants interact directly with each other without intermediaries.
- 4. Autonomous:** The platform operates based on pre-defined rules (e.g., smart contracts) without centralized oversight.
- 5. Transparency:** All transactions or actions are visible to participants.
- 6. Security:** Often relies on cryptography and consensus mechanisms to ensure security and integrity.

WHAT IS BLOCK CHAIN

Block chain is a decentralized, distributed ledger technology that records transactions and data across a network of computers (nodes) in a secure, transparent, and immutable way. Here's how it works:

- **Key Features:**
- 1. **Decentralized:** No single entity controls the entire network.
- 2. **Distributed Ledger:** Data is stored across multiple nodes, ensuring redundancy and security.
- 3. **Immutable:** Once data is recorded, it can't be altered without consensus from the network.
- 4. **Transparent:** All transactions are visible to participants.
- 5. **Secure:** Uses cryptography to protect data and ensure integrity.
